Let's Tour Canada's Leading Technology and Winner of the CO₂ Capture Project Suppling the Carbon XPrize

860 MW Natural Gas-Fired Powerplant jointly owned by ENMAX Energy Corporation and Capital Power at the Shephard Energy Centre in South East Calgary

Imagine! Right here in Calgary, a facility that demonstrates the most advanced Commercial CO₂ Capture technologies in the world.

Our most recent tour saw the likes of Enerflex, Whitecap Resources, Pembina Pipelines, Methanex and Amine Experts. These are some of Canada's elite companies taking the lead to reduce CO₂ emissions. The tour was an insightful experience by all and included the introduction of the Technology Centre, Delta's CO₂ Capture Plant, Delta's Solvent Reclamation System, related CO₂ capture infrastructure and a chance to observe two of the CO₂ utilization technologies for which Delta is supplying the CO₂ namely, Air Company, who produces ethanol and methanol and Carbon Upcycling Technologies, who is infusing fly ash with CO₂ to produce concrete sequestered CO₂

Good news! We will be hosting bi-monthly tours of our North America's newest CO₂ capture technology. These tours are a hot ticket, so be sure to reach out to us and book your team for the next available spot!
